

Results of John Example from unproctored administration of the Abstract-Logical Reasoning Test

The test assesses John Example's ability to identify logical relationships and rules by reviewing processes that are presented schematically. The instrument requires solving problems by analyzing processes and formulating hypotheses about the functions of logical operators. The results provide information about how effectively John Example is able to use logical thinking and analysis of processes with varying degrees of complexity.

This report provides information about the completion of the test in an unsupervised setting. Please keep in mind that in order to be sure of the accuracy of the results received, they have to be verified by administering the proctored version of the Abstract-Logical Reasoning Test in a controlled setting.

The results are presented in a standard 10-point scale created after comparison with the results of a nationally represented sample.

ANALYSIS OF ABSTRACT DATA

John Example demonstrates relatively low ability to understand, evaluate, and analyze information presented in abstract diagrams and patterns. Would probably experience serious difficulties with work tasks involving inductive and deductive reasoning, identifying cause-and-effect relationships, analyzing complex problems, and reviewing system processes.

Using the report

Personal decisions based on the test results should be made only by qualified professionals. This report should be considered only one of the possible sources of information. Efforts should be made to compare and supplement the data provided with other sources of objective information, such as work performance and results, other test and/or assessment center results, etc. This report contains personal information and should be stored in accordance with the law on personal data protection.
